Commissioner for Patents  
P.O. Box 1450  
Alexandria, VA 22313-1450

Dear Sir:

Petitioner, as the owner of the captioned United States patent 7,342,014 ("the '014 patent;" attached as Exhibit A), respectfully requests reconsideration of the reconsideration of dismissal of the Decision on Petitions Under 37 CFR 1.183 and On Request of Reconsideration of Patent Term Adjustment mailed on October 12, 2010 ("October 2010 Decision;" attached as Exhibit B).

On February 2, 2009, Petitioner filed a Petition under 37 CFR 1.705(d) and Request for Reconsideration of Patent Term Adjustment ("Request for Reconsideration") on February 2, 2009 requesting reconsideration of the final patent term adjustment for the '014 patent of 357 days. The patent term adjustment calculation of the United States Patent and Trademark Office ("USPTO"), as detailed in the Request for Reconsideration, is in error due to a failure to account

for the period of time in which the issuance of the '014 patent was delayed beyond three years as set forth in 35 U.S.C. § 154(b)(1)(B). Petitioner requested that the patent term adjustment be changed to the correct 753 days (which reflects an increase of 396 days) as calculated properly under 35 U.S.C. § 154(b) according to the statutory interpretation of the Court of Appeals for the Federal Circuit in Wyeth v. Kappos, 591 F.3d 1364, 93 U.S.P.Q.2d 1257 (Fed. Cir. 2010) ("the Wyeth decision"). Because Petitioner recognized that the Request for Reconsideration was being filed more than two months after the issue date of the '014 patent, the time period for requesting reconsideration of patent term adjustment specified in 37 CFR 1.705(d), Petitioner concurrently filed a petition under 37 CFR 1.183 ("Rule 183 Petition") to suspend the rules so that the USPTO could consider the underlying Request for Reconsideration in a manner consistent with the recent Wyeth decision.

In a decision dated March 30, 2010 ("March 2010 Decision"), the USPTO dismissed Petitioner's Request for Reconsideration and Rule 183 petition. On June 1, 2010, Petitioner filed a Request for Reconsideration of Dismissal of Petition under 37 C.F.R. § 1.183 and Dismissal of Request for Reconsideration of Patent Term Adjustment under 37 C.F.R. § 1.705(d) ("June 2010 Request") asking the USPTO to reconsider the dismissal of the Petitions in the March 2010 Decision. In response, the USPTO issued the October 2010 Decision again dismissing the Request for Reconsideration and the Rule 183 Petition. The October 2010 Decision did not indicate that it was a final agency action and provided Petitioner with two months in which to request reconsideration again. Petitioner notes that an amended complaint was filed in Daiichi Sankyo v. Kappos, Civil Action No. 1:10-cv-00215 (D.D.C. 2010) requesting judicial review of

the patent term adjustment in the '014 patent but not requesting review of the October 2010 Decision as it was not a final agency action.

In a telephone call with Senior Petitions Attorney Shirene Willis Brantley on November 10, 2010, Ms. Brantley indicated that, if Petitioner filed a request for reconsideration of the October 2010 Decision, the USPTO would issue a decision denying the Request for Reconsideration and Rule 183 Petition as a final agency action for purposes of judicial review.

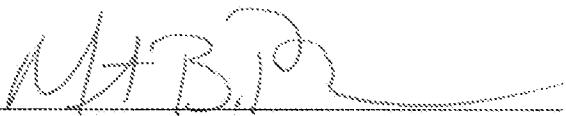

Accordingly, Petitioner respectfully requests that the USPTO reconsider its dismissal of the Request for Reconsideration and the Rule 183 Petition for the reasons set forth in the June 2010 Request and either (1) consider Petitioner's Request for Reconsideration on the merits and revise the patent term adjustment calculation for the '014 patent in accordance with the Wyeth Decision; or (2) deny the Request for Reconsideration and Rule 183 Petition in a final agency action so that Petitioner can seek judicial review of the USPTO's refusal to recalculate the patent term adjustment of the '014 patent. This Request for Reconsideration of the October 2010 Decision is timely filed as it is being filed within two months of the October 12, 2010 mailing date of the October 2010 Decision.

Petitioner does not believe any fees are due in connection with this Request. Nevertheless, the Commissioner is hereby authorized to charge any fees which may be required for consideration of this communication to Deposit Account No. 50-3732, Order No. 17620-105007.

Respectfully submitted,

## TECHNICAL FIELD

The present invention relates to novel compounds which inhibit activated blood coagulation factor X (hereinafter abbreviated as "FXa") to exhibit a potent anticoagulant effect and can be orally administered, and anticoagulants or agents for preventing and/or treating thrombosis or embolism, which comprise such a novel compound as an active ingredient.

## BACKGROUND ART

In unstable angina, cerebral infarction, cerebral embolism, myocardial infarction, pulmonary infarction, pulmonary embolism, Buerger's disease, deep venous thrombosis, disseminated intravascular coagulation syndrome, thrombus formation after valve replacement, reocclusion after angioplasty and thrombus formation during extracorporeal circulation, hypercoagulable state is a pivotal factor. Therefore, there is a demand for development of excellent anticoagulants which have good dose responsiveness, long duration, low risk of hemorrhage and little side effects and fast onset of sufficient effects even by oral administration (Thrombosis Research, Vol. 68, pp. 507-512, 1992).

Based on the research of anticoagulants worked through various mechanism of action, it is suggested that FXa inhibitors are promising anticoagulants. A blood coagulation system comprises a series of reactions that a great amount of thrombin is produced through an amplification process by multi-stage enzyme reactions to form insoluble fibrin. In an endogenous system, activated factor IX activates into factor X on a phospholipid membrane in the presence of activated factor VIII and calcium ions after multi-stage reactions subsequent to activation of a contact factor. In an exogenous system, activated factor VII activates factor X in the presence of a tissue factor. More specifically, the activation of the factor X into FXa in the coagulation system is a crucial reaction in the formation of thrombin. The activated factor X (FXa) limitedly decomposes prothrombin to produce thrombin in the both systems. Since the produced thrombin activates coagulation factors in the upper stream, the formation of thrombin is more amplified. As described above, since the coagulation system in the upper stream of FXa is divided into the endogenous system and the exogenous system, production of FXa cannot be sufficiently inhibited by inhibiting enzymes in the coagulation system in the upper stream of FXa, leading to production of thrombin. Since the coagulation system comprises self-amplification reactions, inhibition of the coagulation system can be more efficiently achieved by inhibiting FXa in the upper stream of thrombin than the inhibition of thrombin (Thrombosis Research, Vol. 15, pp. 617-629, 1979).

## 2

An another excellent point of FXa inhibitors is a great difference between an effective dose in a thrombosis model and a dose elongating bleeding time in an experimental hemorrhagic model. From this experimental result, FXa inhibitors are considered to be anticoagulants having low risk of hemorrhage.

Various compounds have been reported as FXa inhibitors. It is known that antithrombin III and antithrombin III dependent pentasaccharides can generally not inhibit prothrombinase complexes which play a practical role in the thrombus formation in a living body (Thrombosis Research, Vol. 68, pp. 507-512, 1992; Journal of Clinical Investigation, Vol. 71, pp. 1383-1391, 1983; Mebio, Vol. 14, No. 8, pp. 92-97). In addition, they do not exhibit effectiveness by oral administration. Tick anticoagulant peptide (TAP) (Science, Vol. 248, pp. 593-596, 1990) and antistasin (AST) (Journal of Biological Chemistry, Vol. 263, pp. 10162-10167, 1998) isolated from mites or leeches, which are bloodsuckers, also inhibit FXa and exhibit anti-thrombotic effects against venous thrombosis and arterial thrombosis. However, these compounds are high-molecular weight peptides and unavailable in oral administration. As described above, development of antithrombin III independent low-molecular weight FXa inhibitors which directly inhibit coagulation factors has been conducted.

It is therefore an object of the present invention to provide a novel compound which has a potent FXa-inhibiting effect and exhibits an anti-thrombotic effect quickly, sufficiently and persistently by oral administration.

## DISCLOSURE OF THE INVENTION

The present inventors have investigated synthesis and pharmacological effects of novel FXa inhibitors. As a result, diamine derivatives, salts thereof, and solvates and N-oxides thereof, which exhibit potent FXa-inhibiting effect and anti-coagulant effect, have been found. It has also been found that these compounds promptly, persistently and potently inhibit FXa and exhibit potent anticoagulant effect and anti-thrombotic effect by oral administration, and are hence useful as prophylactics and remedies for various diseases based on thromboembolism, thus leading to completion of the present invention.

The preparation process of the diamine derivatives (1) according to the present invention will hereinafter be described.

[Preparation Process 1]

A compound represented by the general formula (1), a salt thereof, a solvate thereof, or an N-oxide thereof can be prepared in accordance with, for example, the following process:

wherein Q<sup>1</sup>, Q<sup>2</sup>, Q<sup>3</sup>, Q<sup>4</sup>, R<sup>1</sup> and R<sup>2</sup> have the same meanings as defined above, and T<sup>1</sup> represents a carbonyl group.

A mixed acid anhydride, acid halide, activated ester or the like, which is derived from carboxylic acid (3), may react with diamine (2), giving compound (4). Further, optical isomers may be present in the respective geometrical isomers. The preparation process of an optically active substance will hereinafter be described.

When the amino group of optically active aminoalcohol derivative (15) prepared by such an already known process or by applying such a process reacts with a proper protecting reagent, compound (16) can be produced. As a protecting group corresponding to  $\text{R}^{50}$  in compound (16), is preferred, among the ordinary acyl type protecting groups, an alkoxy carbonyl group such as methoxycarbonyl, ethoxycarbonyl, tert-butoxycarbonyl group and the like, an arylmethoxycarbonyl group such as benzoxycarbonyl, p-methoxybenzoxycarbonyl, p- or o-nitrobenzyloxy-carbonyl group and the like, or an arylsulfonyl group such as 2,4-dinitrobenzenesulfonyl, o-nitrobenzenesulfonyl group and the like. When the amino group is protected with, for example, a tert-butoxycarbonyl group, aminoalcohol derivative (15) may react with di-tert-butyl dicarbonate at  $-78^\circ\text{C}$ . to  $50^\circ\text{C}$ . in an inert solvent, giving compound (16). The inert solvent may be suitably chosen for use from those described in Preparation Process 1.

Compound (17) may react with sodium azide at  $-10^\circ\text{C}$ . to  $150^\circ\text{C}$ . in a proper solvent, giving compound (18). As the solvent, an amide solvent such as N,N-dimethylformamide, N,N-dimethylacetamide or N-methylpyrrolidin-2-one, an

As a process for converting azide derivative (18) into compound (7a), there are many processes such as a process of conducting hydrogenation with a palladium catalyst, 10 Raney nickel catalyst or platinum catalyst, a reaction using a reducing agent such as lithium aluminum hydride, sodium borohydride or zinc borohydride, a reaction using zinc in the presence of nickel chloride or cobalt chloride, a reaction using triphenylphosphine and the like. Suitable reaction conditions may be selected according to the nature of the compound. For example, azide derivative (18) is hydrogenated at a temperature of  $-10^\circ\text{C}$ . to  $70^\circ\text{C}$ . using 1 to 20% palladium carbon as a catalyst in a proper solvent, whereby compound (7a) can be prepared. The hydrogen pressure may be raised higher than atmospheric pressure. As the solvent, an alcoholic solvent such as methanol or ethanol, an etheric solvent such as tetrahydrofuran, 1,2-dimethoxyethane or dioxane, an amide solvent such as N,N-dimethylformamide, N,N-dimethylacetamide or N-methylpyrrolidin-2-one, an ester solvent such as ethyl acetate, acetic acid, hydrochloric acid, water, a mixed solvent thereof and the like is suitable.

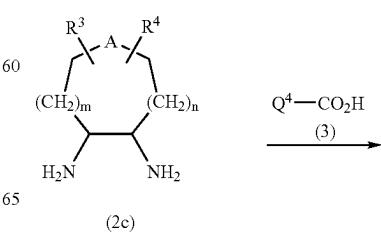

Optically active amine (7a) prepared in accordance with the above-described process can be converted to optically active compound (1) in accordance with the above-described Preparation Process 2. Antipode (1) of optically active substance (1) obtained from optically active amine (7a) may also be prepared in accordance with a similar process.

It is also possible to separate intermediate (2), (4), (7), (8) or (9) for preparing racemic compound (1) through a column composed of an optically active carrier to isolate optically active intermediate (2), (4), (7), (8) or (9), and then prepare optically active compound 40 (1) in accordance with any of Preparation Processes 1 to 4. As a process for isolating optically active compound (1), optically active intermediate (2), (4), (7), (8) or (9), a process of fractionally crystallizing a salt with an optically active carboxylic acid, or a process of fractionally crystallizing a 45 salt with an optically active base on the contrary may be used.

#### [Preparation Process 7]

Among the compounds (1) according to the present invention, a preparation process of compound (1c) containing 50 heteroatom(s) in the group  $\text{Q}^3$  will hereinafter be described in detail.

A compound represented by the general formula (1c), a salt thereof, a solvate thereof, or an N-oxide thereof can be prepared in accordance with, for example, the following 55 process:

wherein  $Q^1$ ,  $Q^2$ ,  $Q^3$ ,  $Q^4$ ,  $R^3$ ,  $R^4$ ,  $m$  and  $n$  have the same meanings as defined above, and  $T^1$  represents a carbonyl group.

A mixed acid anhydride, acid halide, activated ester or the like, which is derived from carboxylic acid (3), may react with compound (2c), giving compound (4c). The reagents and reaction conditions in the reaction of compound (4c) with carboxylic acid (5) are the same as those in the reaction of diamine (2c) with carboxylic acid (3).

As specific examples of the base used in each step, may be mentioned carbonates of alkali metals or alkaline earth metals, such as sodium carbonate and potassium carbonate,

In addition to these solvent, a sulfoxide solvent such as dimethyl sulfoxide, a ketone solvent such as acetone, or the like 20 may be used in some cases.

In the above-described preparation steps, processes such as attaching and leaving of a protecting group, and conversion of a functional group can be suitably applied, thereby preparing compound (1c).

As the protecting group for amino group, it is only necessary to use a protecting group, which is generally used as a protecting group for amino group in syntheses of organic compounds, particularly, peptide synthesis. As the protecting group for hydroxyl group, it is only 40 necessary to use a protecting group for hydroxyl group, which is generally used in syntheses of organic compounds. A carboxyl group can be protected as an ester with an alkyl group such as a tert-butyl group or an arylmethyl group such as a benzyl group. The attaching and 50 leaving of the protecting group may be conducted in accordance with a method known per se in the art.

Compound (1c) according to the present invention can be converted into various derivatives by converting its functional group. For example, a compound in which A is a 55 nitrogen atom having no substituent can be converted into an amide compound by acylation using a mixed acid anhydride, acid halide, activated ester or the like in accordance with ordinary organic chemical methods, a sulfonamide compound by reaction with a sulfonyl halide, an N-alkyl compound by reaction with an alkyl halide, an N-aryl compound by reaction with an aryl halide or a carbamate compound by reaction with an isocyanate. Incidentally, the compound in which A is a nitrogen atom having no substituent can be prepared by, for example, treating compound (1c) prepared 60 from diamine (2c), in which A has been protected with tert-butoxycarbonyl group, in accordance with Preparation Process 7 with an acid.

59

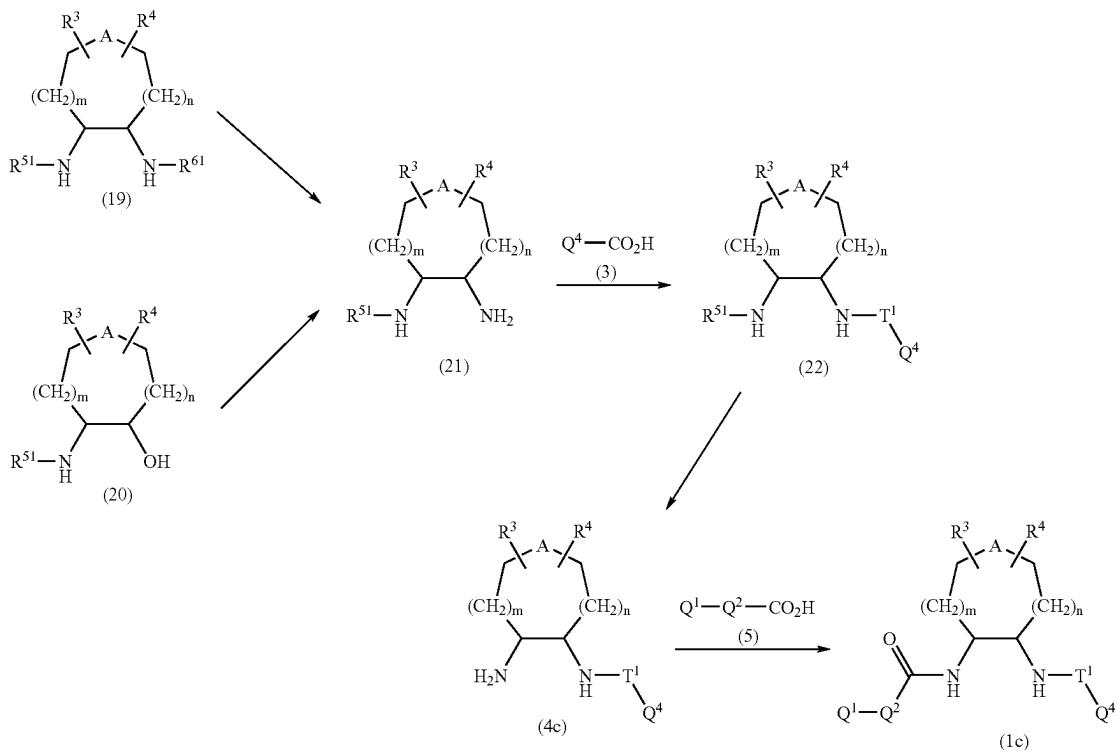

The compounds according to the present invention thus prepared can be isolated and purified by publicly known methods, for example, extraction, precipitation, fractional chromatography, fractional crystallization, recrystallization, etc. The compounds according to the present invention can be converted into desired salts in accordance with ordinary salt-forming reactions.

Optical isomers derived from an asymmetric carbon atom are present in the compounds of the present invention. Such an optically active isomer can be prepared by the process of preparing from optically active diamine (2c), and besides, a process of forming an optically active amine or acid and a salt from racemic compound (1c) and fractionally crystallizing it, a process of separating it by column chromatography using an optically active carrier.

Compound (1c), in which T<sup>1</sup> is a sulfonyl group, can be prepared by changing carboxylic acid (3) to sulfonyl halide (10) in the reaction of compound (2c) with carboxylic acid (3).

[Preparation Process 8]

Compound (1c) according to the present invention can also be prepared in accordance with the following process:

wherein Q<sup>1</sup>, Q<sup>2</sup>, Q<sup>4</sup>, R<sup>3</sup>, R<sup>4</sup>, A, m and n have the same meanings as defined above, T<sup>1</sup> represents a carbonyl group, and R<sup>51</sup> and R<sup>61</sup> represent protecting groups for amino group.

Compound (21) can be prepared by removing the protecting group R<sup>61</sup> of compound (19) obtained by protecting the amino groups of compound (2c). No particular limitation is imposed on the protecting groups for amino acid illustrated as R<sup>51</sup> and R<sup>61</sup> so far as they are groups generally used in protection of the amino group. However, as typical examples thereof, may be mentioned the protecting groups

60

for amino group described in Preparation Process 7. In this case, R<sup>51</sup> and R<sup>61</sup> are required to be protecting groups capable of leaving by different methods or conditions from each other. As typical examples thereof, may be mentioned a combination that R<sup>51</sup> is a tert-butoxycarbonyl group, and R<sup>61</sup> is a benzyloxycarbonyl group. These protecting groups may be chosen for use according to the nature and the like of the compound of which amino groups are to be protected. Upon leaving such a protecting group, reagents and conditions 10 may be employed according to the protecting group.

Compound (21) can also be prepared by converting the hydroxyl group in aminoalcohol derivative (20) into an amino group. As an example of the preparation of aminoalcohol derivative (20), is known conversion of methionine into 3-hydroxy-4-aminothiopyran-1,1-dioxide (Tetrahedron Lett., Vol. 37, p. 7457, 1996).

As a process for converting the hydroxyl group in aminoalcohol derivative (20) into an amino group, may be mentioned a process in which aminoalcohol derivative (20) 20 may react with methanesulfonyl chloride, p-toluenesulfonyl chloride, trifluoromethanesulfonic anhydride or the like, the resultant product may then react with ammonia, a primary

55

arylalkylamine such as benzylamine, p-methoxybenzylamine or 2,4-dimethoxybenzylamine, a secondary arylalkylamine such as dibenzylamine, or a hydroxylamine such as N-benzylhydroxylamine or N,O-dibenzylhydroxylamine, and benzyl group or the like is then removed as needed, thereby preparing diamine (21). Aminoalcohol derivative (20) can also be converted into diamine (21) by reacting it with phthalimide or succinimide in accordance with the reaction with triphenylphosphine and ethyl azodicarboxylate (Mukaiyama method) or the like, and then treating the reaction product with hydrazine or N-methylhydrazine.

61

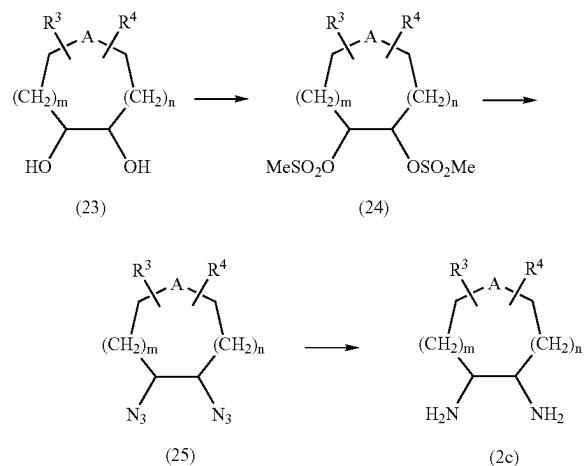

When A in the formula is  $\text{SO}_2$ , and n is 0, diamine (21) can be prepared by adding ammonia, a primary arylalkylamine such as benzylamine, p-methoxybenzylamine or 2,4-dimethoxybenzylamine, a secondary arylalkylamine such as dibenzylamine, or a hydroxylamine such as N-benzylhydroxylamine or N,O-dibenzylhydroxylamine to an  $\alpha,\beta$ -unsaturated cyclic sulfone formed by reacting aminoalcohol derivative (20) with methanesulfonyl chloride, p-toluenesulfonyl chloride, trifluoromethanesulfonic anhydride or the like and then treating the reaction product with a proper base or directly reacting aminoalcohol derivative (20) with triphenylphosphine and ethyl azodicarboxylate, and removing the benzyl group or the like as needed.

The resultant diamine (21) may react with carboxylic acid (3), giving compound (22). The protecting group  $R^{51}$  is successively removed, giving compound (4c). Compound (4c) may react with carboxylic acid (5), giving compound (1c) according to the present invention. The reagents and reaction conditions in the reaction of compound (21) with carboxylic acid (3) and the reaction of compound (4c) with carboxylic acid (5) may be the same as those described in Preparation Process 7.

Similarly, compound (1c) in which  $T^1$  is a sulfonyl group can be prepared by changing carboxylic acid (3) to sulfonyl halide (10) in the reaction of compound (21) with carboxylic acid (3).

[Preparation Process 9]

wherein R<sup>3</sup>, R<sup>4</sup>, A, m and n have the same meanings as defined above.

As preparation processes of diol derivative (23), are known, for example, conversion of 1,2,3,6-tetrahydropyridine into 1-benzyloxycarbonyl-3,4-cis-dihydroxypyrridine (Japanese Patent Application Laid-Open No. 138264/1995), conversion of L-tartaric acid into (R,R)-tetrahydrofuranediol or (R,R)-N-benzylpyrrolidinediol (Tetrahedron: Asymmetry, Vol. 8, p. 1861, 1997). Diol derivative (23) can be prepared by using such an already known process or applying such a process and removing a protecting group or converting a functional group as needed.

62

Diol derivative (23) may react with methanesulfonyl chloride at a temperature under cooling to room temperature in the presence of a base in an inert solvent, giving compound (24). The inert solvent may be suitably chosen for use from those described in Preparation Process 7. However, particularly preferred are alkyl halide type solvents such as methylene chloride and chloroform, and etheric solvents such as tetrahydrofuran and 1,4-dioxane. As the base, is preferred an organic base such as pyridine, 2,6-lutidine, 4-dimethylaminopyridine, triethylamine, N-methylmorpholine, diisopropylethylamine or diazabicyclo-[5.4.0]undec-7-ene (DBU).

As the solvent, an amide solvent such as N,N-dimethylformamide or N-methylpyrrolidin-2-one, an alcoholic solvent such as methanol or ethanol, an etheric solvent such as tetrahydrofuran or 1,4-dioxane, benzenoid solvent such as benzene or toluene, a carbon halogenide such as methylene chloride or chloroform, dimethyl sulfoxide, acetone, or the like is suitable. Such a solvent may be a mixed solvent with water.

As a process for converting azide derivative (25) into compound (2c), there are many processes such as a process of conducting hydrogenation with a palladium catalyst, Raney nickel catalyst or platinum catalyst, a reaction using a reducing agent such as lithium aluminum hydride or sodium borohydride, a reaction using zinc in the presence of nickel chloride or cobalt chloride, and a reaction using triphenylphosphine. Suitable reagents and reaction conditions may be selected according to the nature of the compound. The hydrogen pressure may be raised higher than atmospheric pressure. As the solvent, an alcoholic solvent such as methanol or ethanol, an etheric solvent such as tetrahydrofuran or 1,4-dioxane, an amide solvent such as N,N-dimethylformamide or N-methylpyrrolidin-2-one, an ester solvent such as ethyl acetate, acetic acid, hydrochloric acid, water, or a mixed solvent thereof is suitable. Compound (1c) according to the present invention can be derived from diamine derivative (2c) prepared in accordance with the above-described process in accordance with Preparation Process 7.

When diol derivative (23) is trans-3,4-dihydroxytetrahydrofuran or trans-1-substituted 3,4-dihydroxypyrridine, optically active substances are present. These optically active diol derivatives (23) can be converted into optically active diamine derivatives (2c), and further into optically active compounds (1c) according to the present invention in accordance with Preparation Process 7.

Chem., Vol. 57, p. 6279, 1992, etc.) or by applying such a process. Optically active α,β-unsaturated ester derivative (26) may react with an amine at a temperature under cooling to a temperature under heating in a proper solvent, giving diastereomers (27a) and (27b). The amine may be suitably chosen for use from those described in Preparation Process 8. The solvent is desirably an organic solvent unreactive to a substrate, product or reagent, particularly, an alcoholic solvent such as methanol or ethanol, or an etheric solvent such as tetrahydrofuran, 1,2-dimethoxyethane or 1,4-dioxane. The compound (140 mg) obtained in Referential Example 144 was dissolved in N,N-dimethylformamide (10 ml), and the compound (100 mg) obtained in Referential Example 274, 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (140 mg) and 1-hydroxybenzotriazole monohydrate (110 mg) were added to stir the mixture at room temperature for 18 hours. The solvent was distilled off under reduced pressure, and the residue was partitioned in water-ethyl acetate, and a water layer was extracted with ethyl acetate. The resultant organic layers were combined, washed with saturated aqueous solution of sodium chloride and then dried over anhydrous sodium sulfate. The solvent was distilled off under reduced pressure, and the residue was purified by column chromatography on silica gel (methanol: methylene chloride=1:19), giving tert-butyl (1R,2S,5S)-2-{[(5-chloro-4-fluoroindol-2-yl)carbonyl]amino}-5-[(dimethylamino)carbonyl]cyclohexylcarbamate (260 mg).

The thus-obtained powder was dissolved in methylene chloride (5 ml), and a 4N dioxane solution (1.2 ml) of hydrochloric acid was added. After the reaction mixture was stirred at room temperature for 3.5 hours, the solvent was distilled off under reduced pressure. Methylene chloride (10 ml) was added to the residue, and the mixture was concentrated. After this process was repeated 3 times, the residue was dried under reduced pressure to obtain crude N-[(1S,2R,4S)-2-amino-4-[(dimethylamino)carbonyl]-cyclohexyl]-5-chloro-4-fluoroindole-2-carboxamide. This product was dissolved in N,N-dimethylformamide (50 ml), and the compound (150 mg) obtained in Referential Example 10, 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (140 mg) and 1-hydroxybenzotriazole monohydrate (110 mg) were added to stir the mixture at room temperature for 18 hours. The solvent was distilled off under reduced pressure, and the residue was partitioned in a mixed solvent of water-ethyl acetate-tetrahydrofuran, and a water layer was extracted with ethyl acetate. The resultant organic layers were combined, washed with saturated aqueous solution of

## TEST EXAMPLE 1

Determination of Human FXa-inhibiting Effect  
(IC<sub>50</sub> Value)

5% DMSO solutions (10 μl) of each test compound, the concentrations of which were suitably set stepwise, Tris buffer (100 mM Tris, 200 mM potassium chloride, 0.2% BSA, pH 7.4) (40 μl) and 0.0625 U/ml human FXa (Enzyme Research Laboratories, Inc., dissolved and diluted with Tris buffer) (10 μl) were respectively put in wells of a 96-well microplate, and a 750 μM aqueous solution (40 μl) of S-2222 (Chromogenix Co.) was added. Absorbance at 405 nm was measured for 10 minutes at room temperature to determine an increase in absorbance (ΔOD/min). As a control, Tris buffer was used in place of the test compound.

The percent inhibition (%) calculated using the following equation at the final concentration of the test compound and the final concentration of the test compound were plotted on the axis of ordinate and the axis of abscissa of logarithmic normal probability paper, respectively, to determine the 50% inhibition dose (IC<sub>50</sub> value).

Percent inhibition (%) =

$$[1 - (\Delta OD/min \text{ of test compound}) / (\Delta OD/min \text{ of control})] \times 100$$

## (Result)

In Table 1, it is demonstrated that the compounds according to the present invention have a potent FXa-inhibiting effect.

## TEST EXAMPLE 2

Determination of Anti-FXa Activity in Rat Plasma  
After Oral Administration

## (A) Administration and Blood Collection:

A drug solution (1 mg/ml) obtained by dissolving or suspending a test compound (10 mg) in 0.5% methyl cellulose (MC) was orally administered to rats (10 ml/kg). After 0.5, 1, 2 and 4 hours from the drug administration, the blood (0.5 ml) was collected through the jugular vein using a syringe which is containing a 3.13% (w/v) aqueous solution (50 μl) of trisodium citrate dihydrate (amount of blood collected: 0.45 ml). For rats of a control group, the same blood collection was conducted after a 0.5% MC solution was administered. Each blood sample was centrifuged at 1500×g for 10 minutes at 4° C. to separate plasma, and the plasma was preserved at -40° C. until it was used in the following determination of anti-FXa activity in plasma.

## (B) Determination of FXa-inhibiting Activity in Plasma:

In the determination of anti-FXa activity in plasma, S-2222 was used as a substrate. Tris buffer (100 mM Tris, 200 mM potassium chloride, 0.2% BSA, pH 7.4) (5456 μl), human FXa (2.5 U/ml, 44 μl) and water (550 μl) were mixed. The resultant human FXa solution was used in the following test.

Rat plasma (5 μl) obtained in accordance with the procedure (A) described above was put in wells of a 96-well microplate, and the above-described human FXa solution (55 μl) and a 750 μM aqueous solution (40 μl) of S-2222 were sequentially added. Immediately after that, absorbance at 405 nm was measured at room temperature by means of a spectrophotometer SPECTRAmax 340 or 190 (Molecular Devices Co., U.S.A.), thereby determining a rate of reaction (ΔOD/min).

The anti-FXa activity, i.e., percent inhibition (%) was calculated in accordance with the following equation:

$$\text{Percent inhibition (\%)} = [1 - (\Delta OD/min \text{ of sample}) / (\text{average value of } \Delta OD/min \text{ of the control group})] \times 100$$

## (Result)

55 The compounds described in Examples 63, 191, 192, 194 and 204 exhibited a potent FXa-inhibiting activity of 62 to 96% at an oral dose of 10 mg/kg.

Title: DIAMINE DERIVATIVES :

This is in response to the "REQUEST FOR RECONSIDERATION OF DISMISSAL OF PETITION UNDER 37 C.F.R. § 1.183 AND OF DISMISSAL OF REQUEST FOR RECONSIDERATION OF PATENT TERM ADJUSTMENT UNDER 37 CFR § 1.705(d)," filed on June 1, 2010. Patentees petition under 37 C.F.R. § 1.183 for suspension of the requirement under 37 C.F.R. § 1.705(d) that any request for reconsideration of the patent term adjustment indicated in the patent must be filed within two months of the date the patent issued. Further, patentees request that the patent term adjustment be corrected from three hundred fifty-seven (357) days to seven hundred fifty-three (753) days.

The petition pursuant to 37 C.F.R. § 1.183 is **DISMISSED**.

The petition pursuant to 37 C.F.R. § 1.705(d) is **DISMISSED AS UNTIMELY FILED**.

Any request for reconsideration, whether directed to the decision on petition under 37 CFR § 1.183 or to the decision on the request under 37 CFR 1.705(d), must be filed within two months of the mailing date of this decision. Extensions of time under 37 C.F.R. § 1.136 are NOT permitted. See 37 CFR § 1.181(f).

**RELEVANT STATUTE AND RULES**

35 U.S.C. § 154(b)(3)(B) sets forth, *in toto*:

Under the procedures established under subparagraph (A), the Director shall-

- (i) make a determination of the period of any patent term adjustment under this subsection, and shall transmit a notice of that determination with the written notice of allowance of the application under section 151; and
- (ii) provide the applicant one opportunity to request reconsideration of any patent term adjustment determination made by the Director.

37 CFR § 1.183 sets forth, *in toto*:

In an extraordinary situation, when justice requires, any requirement of the regulations in this part which is not a requirement of the statutes may be suspended or waived by the Director or the Director's designee, *sua sponte*, or on petition of the interested party, subject to such other requirements as may be imposed. Any petition under this section must be accompanied by the petition fee set forth in § 1.17(f).

37 CFR § 1.705 sets forth, *in pertinent part*:

If there is a revision to the patent term adjustment indicated in the notice of allowance, the patent will indicate the revised patent term adjustment. If the patent indicates or should have indicated a revised patent term adjustment, any request for reconsideration of the patent term adjustment indicated in the patent must be filed within two months of the date the patent issued and must comply with the requirements of paragraphs (b)(1) and (b)(2) of this section. Any request for reconsideration under this section that raises issues that were raised, or could have been raised, in an application for patent term adjustment under paragraph (b) of this section shall be dismissed as untimely as to those issues.

**OPINION**

On March 11, 2008, the above-identified application matured into U.S. Patent No. 7,342,014 with a revised patent term adjustment of 357 days. No request for reconsideration of the patent term adjustment indicated in the patent was filed within two months of the date the patent issued.

A request for reconsideration of the patent term adjustment indicated in the patent under 37 CFR 1.705(d) and a petition under 37 CFR 1.183, both filed on February 2, 2009, were dismissed on March 30, 2010.

The present reconsideration petitions were filed on June 1, 2010, which was the first business day after the May 30, 2010 two month deadline to request reconsideration.

Having considered patentees' petition, it is concluded that in this instance waiver of the requirement that the application for patent term adjustment be filed within two months of the issuance date of the patent is not appropriate. Patentees have not shown that the circumstance of the failure to comply with the time period for filing an application for patent term adjustment set forth in 37 CFR 1.705(d), is an extraordinary situation for which justice requires waiver.

By the express provisions of 37 CFR 1.705(d), a request for reconsideration of patent term adjustment must be filed within two months of the date the patent issued. It is undisputed that no such request for reconsideration was filed by May 11, 2008, the date two months from the date this patent issued, March 11, 2008.

35 U.S.C. 154, requires the Office to provide the applicant one opportunity to request reconsideration of any patent term adjustment determination made by the Director, authorizes the Director to establish the procedures for requesting such reconsideration. Those procedures<sup>1</sup> include 37 CFR 1.705(d). 37

---

<sup>1</sup> 35 U.S.C. § 154(b)(3) provides that the USPTO shall: (1) prescribe regulations establishing procedures for the application for and determination of patent term adjustments under 35 U.S.C. § 154(b); (2) make a determination of any patent term adjustment under 35 U.S.C. § 154(b) and transmit a notice of that determination with the notice of allowance under 35 U.S.C. § 151; and (3) provide the applicant one opportunity to request reconsideration of any patent term adjustment determination. Pursuant to the mandate and authority in 35 U.S.C. § 154(b)(3), the USPTO promulgated 37 C.F.R. § 1.705, which provides that: (1) the notice of allowance will include notification of any patent term adjustment under 35 U.S.C. § 154(b)(37 C.F.R. § 1.705(a)); (2) any request for reconsideration of the patent term adjustment indicated in the notice of allowance (except as provided in 37 C.F.R. § 1.705(d)) must be by way of an application for patent term adjustment filed no later than the payment of the issue fee and accompanied by (inter alia) the fee set forth in 37 C.F.R. § 1.18(e)(37 C.F.R. § 1.705(b)); and (3) if the patent indicates or should have indicated a revised patent term adjustment, any request for reconsideration of the patent term adjustment indicated in the patent must be filed within two months of the date the patent issued.

CFR 1.705(d) provides an avenue before the Office for requesting reconsideration of the Office's determination of patent term adjustment indicated in the patent. Moreover, §1.705(d) states that "any request for reconsideration of the patent term adjustment indicated in the patent must be filed within two months of the date the patent issued and must comply with the requirements of paragraphs (b)(1) and (b)(2) of this section."

Patentees have not shown that any extraordinary situation prevented them from timely filing a petition under 37 CFR 1.705(d). Under these circumstances, justice does not require that patentees' failure to timely file an application for patent term adjustment be treated any differently than any other patentee. Waiver of the requirement is not warranted.

The facts of record do not support an extraordinary situation. There is nothing extraordinary about a registered practitioner who is faced with a deadline, and has limited time to submit a paper to the Office to preserve his rights. Moreover, there is nothing extraordinary about a practitioner who failed to act in concert with published regulations.

The Office concludes that this situation does not constitute an extraordinary situation such that justice requires the waiver of the Rule.

As there is no dispute that this application for PTA was filed more than two months after the patent issued and it has been concluded that waiver of the requirement is not warranted, it is appropriate to dismiss this application for patent term adjustment as being untimely filed. On February 1, 2010, the USPTO published a Federal Register notice that, *inter alia*, announced a limited waiver of the two-month deadline for filing a petition for reconsideration of a PTA determination under 37 CFR § 1.705(d). See *Interim Procedure for Patentees to Request a Recalculation of the Patent Term Adjustment to Comply with the Federal Circuit Decision in Wyeth v. Kappos Regarding Overlapping Delay Provisions of 35 U.S.C. § 154(b)(2)(A)*, 75 Fed. Reg. 5043 (Feb. 1, 2010) (notice). Specifically, patent owners were permitted to request recalculation of a patent's PTA in view of the Federal Circuit decision *Wyeth v. Kappos*, 591 F.3d 1364 (Fed. Cir. 2010) up to 180 days after the grant of the patent. The USPTO determined not to accept any requests for PTA recalculation initially filed more than 180 days after patent

grant, however, in view of the statutory judicial-review provisions of 35 U.S.C. sec. 154(b)(4), which require that any civil action to challenge the USPTO's PTA determination be brought within 180 days of patent grant. The USPTO believes that the statutory 180-day period for seeking court review of the USPTO's PTA determinations, particularly in view of the six-year statute of limitations that otherwise is applicable for actions under the Administrative Procedure Act, indicates a congressional intent that PTA issues be resolved shortly after a patent issues. The USPTO does not consider it likely that Congress created a scheme under which the time period to seek initial USPTO review of a PTA determination extends beyond the time period provided for a dissatisfied patentee to seek judicial review of the USPTO's PTA determination. Thus, the USPTO believes that the 180-day period in 35 U.S.C. sec. 154(b)(4) represents the outer limit on the USPTO's ability to conclude its PTA determination.

It is noted that the first petition under 37 CFR 1.705(d) was filed 329 days after the patent issued.

In view thereof, it is concluded that the initial determination of Patent Term Adjustment of three hundred fifty-seven (357) days will not be reconsidered.

The Office acknowledges previous submission of the \$200.00 fee set forth in 37 CFR 1.18(e) and the \$400.00 fee set forth in 37 CFR 1.17(f). No additional fees are required.
